Configure Server Settings	4
Table 3.1	4
Set Up Sync Preferences	5
Table 4.1	5

With our Hosted Exchange environment deploying an iOS is very simple, you only need to know your **email address, exchange server, and password.**

Step 1: Launch Mail App

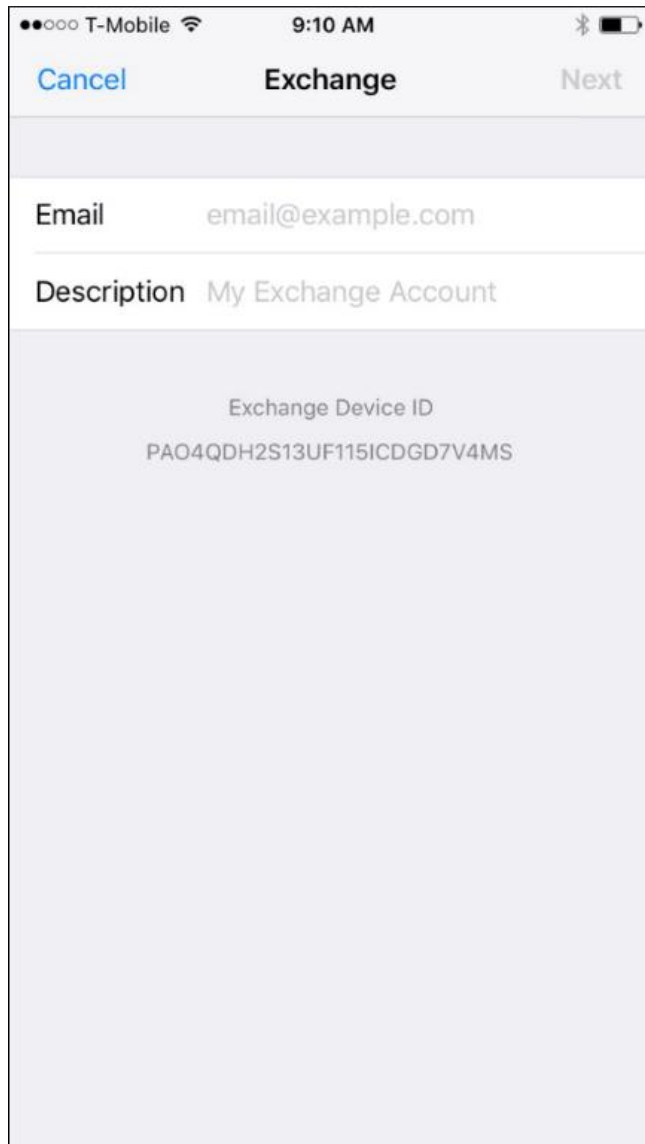

Launch the Mail app, and **select** Microsoft Exchange.

(Table 1.1)

Step 2: Add Email Address

On the next screen, please **input** the email address and username (which are the same) and your password. Then **select** "Next".

(Table 2.1)

Step 3: Configure Server Settings

If you have a correctly set-up AutoDiscover record, the iOS device will resolve the server. If you do not have an AutoDiscover record in place you will need to manually enter cas.louie.exchangedefender OR your assigned server. Once you are done confirming the information **select "Next"**.

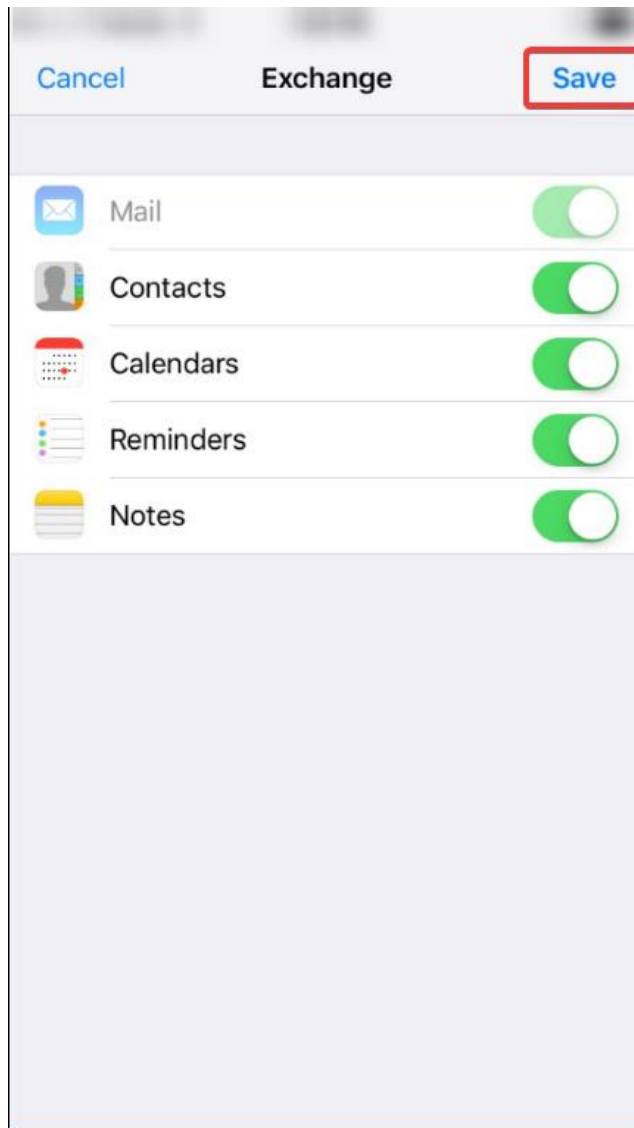

The screenshot shows the 'Exchange' configuration screen on an iOS device. At the top, there are three buttons: 'Cancel', 'Exchange', and 'Save'. Below the buttons, the following fields are visible:

- Email: demo@domain.com
- Server: cas.rockerduck.exchangedefender.c...
- Domain: Optional
- Username: demo
- Password: A series of 15 black dots representing a masked password.
- Description: Exchange
- Exchange Device ID: A blurred text field.

(Table 3.1)

Step 4: Set Up Sync Preferences

On the next step you set up your Sync preferences. Once you are done **select** "Save". Once you **select** Save, you have successfully set up your iOS device with ActiveSync.

(Table 4.1)
